

Office - Spreadsheets

Prepare csv file

Make a spreadsheet in eg. Libre office or Excel.

Export as **.csv** with the default / the following settings:

Field delimiter: ,

String delimiter: "

☐ Save cell content as shown

☐ Save cell formulas instead of calculated values

☒ Quote all text cells

☐ Fixed column width

Put **.csv** in **data/**.

URL parameters

Parameter	Meaning
scene	onload, the script looks out for the .csv in data/*scene*.csv
font	win95,win95-mono,topaz,'Courier New',Roboto,Garuda or any standard font.
fontSize	gets divided by 12 to get em sizes
bgColor	in hex (without #)
borderColor	in hex (without #)
fontColor	in hex (without #)
zoom	int percent, 100% = 16px
hideRulers	true or false to hide the first column and first row
hideTextBtn	Hides the text-styling things to not look as much as a word processor

Styling cells

Column width, row height and styling does not translate automatically from your Libre office / Excel document when exporting as **.CSV**.

Here are some styling options and functions you *can* use.

Everything in **[]** brackets gets interpreted in a certain way. Each parameter is terminated by **;**.

Example	Meaning
---------	---------

Example	Meaning
<pre>[red] [red; blueBg] [bold; center; red; blueBg]</pre>	These are interpreted as classnames and added to the <code>input</code> element
<pre>[color:#563451] [color:#563451; overflow-x:hidden]</pre>	This is added as css-properties to the <code>input</code> element
<pre>[colspan:7]</pre>	This enlarges the current cell by 7 cells to the right. Note that I do not care for overwriting the cells next to it, they get moved by that amount. You have to move the cells accordingly. You'll figure out what I mean.
<pre>[forceType:'this text gets auto typed']</pre>	This forces the user to type <code>this text gets auto typed</code> in that particular cell
<pre>[red; color:#452312; colspan:4; forceType:'this is a test']</pre>	Combine everything.
